EI241401	Control Systems	3-0-0	3

Prerequisites: Mathematics for Engineering Systems

Course Outcome (CO): After completion of the course, the students will be able to

- **CO1:** Distinguish between open loop and closed loop control systems
- **CO2:** Develop mathematical models of control systems and its components
- **CO3:** Analyze transient and steady-state behavior of control systems
- **CO4:** Analyze stability of control systems using analytical and graphical techniques
- **CO5:** Design compensators for control systems

MODULE 1: Elementary concepts of control systems (4 Lectures)

Introduction to control systems, history and development of automatic control; open loop and closed loop control; linear and non-linear control, linear time invariant systems, continuous and discrete time analog and digital control systems; block diagram representation of control systems.

MODULE 2: Mathematical models of physical systems (7 Lectures)

Definition and properties of transfer function; open loop and closed loop transfer function, feedback characteristics of control systems, characteristic equation; transfer function of electrical and mechanical systems; analogous systems: force-voltage and force-current analogy; block diagram reduction technique and signal flow graph.

MODULE 3: Introduction to control system components (3 Lectures)

Controller components, potentiometer, AC/DC servomotors, tacho-generator, synchros, stepper motor.

MODULE 4: Time-domain analysis (7 Lectures)

Introduction to transient response; Test signals: impulse, step, ramp and parabolic signals; transient response of first and second-order control systems, transient response specifications; steady state errors, error constants, types of systems, generalized error constants.

MODULE 5: Stability analysis (5 Lectures)

Concept of control system stability; Routh-Hurwitz stability criterion; Root locus techniques, design of control systems using root locus techniques.

MODULE 6: Frequency response analysis (8 Lectures)

Frequency response and specifications; polar plot; stability analysis using Bode plot and Nyquist plot, Nyquist stability criterion.

MODULE 7: Introduction to controller design (6 Lectures)

The design problem, approaches to the design problem, preliminary considerations of classical design; selection and realization of basic compensators, lead, lag and lead-lag compensators, compensation techniques; PI, PD and PID controllers

5. Rao V. Dukkupati, Analysis and Design of Control systems using MATLAB, New Age International Publishers, 2nd Edition
6. NPTEL course as suggested by the department

Course Code	Course Title	Hours per week L-T-P	Credit
EE241402	Electrical Machines-II	3-0-0	3

Prerequisites: Electrical Machine-I

Course Outcome (CO): After completion of the course, the students will be able to

- **CO1:** Understand the working of 3-phase induction motor
- **CO2:** Analyze the performance parameters of a 3-phase induction motor.
- **CO3:** Analyze the performance of Alternators
- **CO4:** Analyze the performance of Synchronous motors
- **CO5:** Apply the knowledge of special motors for different applications.

MODULE 1: Poly-phase Induction Machines (12 Lectures)

Construction, types (squirrel cage and slip-ring), three windings spatially shifted by 120 degrees (carrying three-phase balanced currents), revolving magnetic field; operating principle of poly-phase induction motors, torque slip characteristics, starting and maximum torque, equivalent circuit, phasor diagram, losses and efficiency, cogging and crawling, methods of starting, braking and speed control of induction motors; generator operation, self-excitation.

MODULE 2: Single-phase Induction Motors (7 Lectures)

Constructional features of single-phase induction motor; magnetic field produced by a single winding - fixed current and alternating current; double revolving field theory, equivalent circuit, determination of parameters, Split-phase starting methods and applications.

MODULE 3: Synchronous Machines (15 Lectures)

Physical arrangement of windings in stator and cylindrical rotor; slots for windings, full-pitch and short-pitch coils, concentrated winding, distributed winding, winding axis.

Principles of operation of synchronous generators, emf equation; armature reaction, leakage reactance, synchronous reactance and impedance of non-salient pole machines; short circuit and open circuit tests, short circuit ratio, MMF in salient and non-salient pole machines. Calculation of regulation by synchronous impedance method. MMF method and ASA method.

Introduction to two-reactance theory, slip test, synchronization, power angle diagram and synchronizing power; sub-transient and transient reactance of synchronous machine; parallel operation and load sharing of synchronous machines.

Construction and principles of operation of synchronous motor; phasor diagram, effect of varying excitation, effect of load variation, V-curve, O-Curves, hunting, two-reaction theory of salient-pole motor, starting of synchronous motor; synchronous phase modifiers.

MODULE 4: Special Motors (6 Lectures)

Phase Commutator Motors: Universal and repulsion motors, construction and principle of operation, starting methods, speed control, improvement of commutation and power-factor by compensation.

Reluctance Motors (Conventional and Switched): Construction and principle of operation, speed-torque characteristic.

Stepper Motor: Construction and principle of operation, types, characteristics; selection and application.

Brush-less DC (BLDC) motor: Construction and principle of operation, types and applications.

9. NPTEL course as suggested by the department

Course Code	Course Title	Hours per week L-T-P	Credit
EI241403	Microprocessors and Microcontrollers	3-0-0	3

Prerequisites: Analog electronics and Digital Electronics

Course Outcome (CO): After completion of the course, the students will be able to

- **CO1:** Explain the basic architecture and operation of 8-bit 8085 microprocessors
- **CO2:** Develop programs in 8085 assembly language for academic and industrial applications
- **CO3:** Interfacing peripheral devices to the 8085 microprocessors
- **CO4:** Describe basic architecture of 8086 16-bit microprocessor
- **CO5:** Design simple microcontroller-based applications using compatible peripherals

MODULE 1: Architecture of Microprocessors (8 Lectures)

Introduction to microprocessors, microcomputer and microcontroller, microprocessors architecture and its operations, memory classification and interfacing, 8085 microprocessor architecture, pins and signals, memory mapping and address decoding, Interfacing I/O devices with peripheral I/O and memory mapped I/O

MODULE 2: Programming of 8085 (10 Lectures)

Data Transfer operations, Arithmetic operations, Logic Operations, Branch operation, 8085 instruction format and, addressing modes; assembly language programming of 8085. Programming techniques: looping, counting and indexing, delay routines. Instruction cycle, machine cycle, T-state, bus timing diagrams. Stack and subroutine usage, 8085 interrupt process, software and hardware interrupts, their priorities, concepts of Direct Memory Access.

MODULE 3: Interfacing Devices (6 Lectures)

8255, 8253 and 8279 Programmable Interfacing devices, various modes of operation and interfacing to 8085, designing simple systems for interfacing 8085 to I/O devices using PPIs

MODULE 4: 8086 Architecture (6 Lectures)

Architecture, pin description, physical address, segmentation, memory organization, addressing modes, basic programming.

MODULE 5: Introduction to Microcontrollers (10 Lectures)

Overview of 8051 Microcontroller, Architecture, I/O Ports, PSW and Flag Bits, 8051 register banks and stack, internal memory organization of 8051, types of special function registers and their uses in 8051, addressing modes and instruction set of 8051, simple programs. arithmetic, logic instructions and programs, jump, loop and call instructions.

6. NPTEL course as suggested by the department

Course Code	Course Title	Hours per week L-T-P	Credit
EE241404	Transmission and Distribution of Electric Power	3-0-0	3

Prerequisites: Basic Electrical Engineering

Course Outcome (CO): After completion of the course, the students will be able to

- **CO1:** Understand the structure and components of an electric power system including generation, transmission, and distribution, along with the layout of an interconnected network.
- **CO2:** Evaluate transmission line parameters and performance using appropriate electrical models
- **CO3:** Explain the construction, operation, and performance of insulators and underground cables.
- **CO4:** Explain the concept of neutral grounding and overvoltage phenomenon in a power system
- **CO5:** Analyse different types of AC and DC distribution system

MODULE 1: General Introduction (2 Lectures)

The basic structure of power system: Generation, transmission, and distribution. Various levels of power transmission and basic layout arrangement of an inter-connected power system network

MODULE 2: Transmission line Parameters (8 Lectures)

Conductor materials, types of conductors – ACSR, expanded ACSR, stranded, bundled and composite conductors. standard wire tables, current distortion effect – skin effect and proximity effect; inductance of a single phase system with composite conductors; inductance and capacitance of 1-ph and 3-ph single circuit and double circuit transmission lines with symmetrical and unsymmetrical spacing; Transposition; concept of GMD and GMR; effect of earth in 1-ph & 3-ph lines; charging current.

MODULE 3: Performance of Transmission Lines (8 Lectures)

Classification of transmission lines – short, medium and long lines; Nominal-T and Nominal- π representation of medium lines; analysis of long transmission line (Rigorous method); regulation and efficiency; ABCD parameters of a transmission line, surge impedance loading (SIL), Ferranti effect.

MODULE 4: Mechanical Design (6 Lectures)

Pole structure and Sag calculation: Types of poles, effect of wind, ice and temperature on sag; stringing chart.

Insulators: Types, voltage distribution on an insulator string, stringing efficiency; methods of grading of insulators and static shielding; testing of insulators.

Corona: Electric stress at the surface of overhead line conductors; disruptive critical voltage, visual critical voltage; corona loss, factors affecting corona loss, method of reducing corona loss.

MODULE 5: Underground Cables (6 Lectures)

Different types of underground cables; insulating materials; insulation resistance; breakdown of cable insulation; high voltage cables-internal and external gas pressure cables; capacitance of single & multi core cables; grading of cables; insulation sheath losses; dielectric losses; thermal ratings; testing of cables; maximum current carrying capacity of cables.

MODULE 6: Neutral grounding (4 Lectures)

Effectively grounded system, arcing ground, methods of neutral grounding, reactance and resonant grounding (Peterson coil), earthing transformers, equipment grounding, generator neutral breaker.

MODULE 7: Distribution (6 Lectures)

Classification of distribution system-AC & DC; design consideration in a distribution system, scheme of connections – radial, ring-main, interconnected DC distribution, stepped distributors, concentrated and distributed loads in radial distributors fed at one /both ends. ring distributors with inter connectors.

4. J B Gupta, Transmission and Distribution of Electrical Power, S.K. Kataria& Sons, 2013
5. Nagrath and Kothari, Power System Engineering, McGraw-Hill, 2019
6. M V Despande, Electrical Power System design, McGraw-Hill, 1985
7. NPTEL course as suggested by the department

Course Code	Course Title	Hours per week L-T-P	Credit
EI241405	Signals and Systems	3-0-0	3

Prerequisites: Mathematics for Engineering Systems

Course Outcome (CO): After completion of the course, the students will be able to

- **CO1:** Identify various types of signals in continuous-time and discrete-time domain
- **CO2:** Illustrate Linear Time Invariant (LTI) systems and its properties
- **CO3:** Apply Fourier Series, Fourier Transform and z-transform techniques in signal processing of LTI systems
- **CO4:** Apply sampling techniques in signal processing
- **CO5:** Design digital filters using z-transform technique

MODULE 1: Introduction to signals and systems (5 Lectures)

Continuous-time and discrete-time signals, signal energy & power, even & odd signals, periodic signals, exponential and sinusoidal signals; transformation of independent variables: time-shift, time-reversal, time-scaling; unit step and unit impulse functions, Discrete-Time (DT) and Continuous-Time (CT) systems

MODULE 2: Linear-Time-Invariant (LTI) Systems (8 Lectures)

DT & CT LTI systems: convolution sum, convolution integral; properties of LTI systems; LTI system with and without memory; Invertibility, causality and stability of LTI systems; LTI systems described by differential and difference equations and block diagrams

MODULE 3: Fourier Series Analysis of Signals (7 Lectures)

Response of LTI system to CT and DT complex exponentials, Fourier series representation of CT and DT periodic signals, properties of CT and DT Fourier series, convergence of Fourier series

MODULE 4: Fourier Transform Analysis of Signals (8 Lectures)

Fourier transform of DT and CT aperiodic and periodic signals, properties of CT and DT Fourier Transforms, convergence of Fourier Transforms, Inverse Fourier Transforms; LTI system characterized by linear constant-coefficient difference and differential equations

MODULE 5: Sampling (4 Lectures)

Representation of a CT signal by its samples, Sampling Theorem; Concept of under-sampling, reconstruction of signals from its samples

MODULE 6: Z-Transform (8 Lectures)

Definition, Region of Convergence (ROC), z-transform and inverse z-transform of signals, properties of z-transform, analysis and characterization of LTI systems using z-transforms, system functions and application to system analysis, FIR and IIR systems, realization of FIR and IIR filters

7. NPTEL course as suggested by the department

Course Code	Course Title	Hours per week L-T-P	Credit
HS241406	Finance and Accounting	3-0-0	3

Prerequisites: High School Education

Course Outcome (CO): After completion of the course, the students will be able to

- **CO1:** Develop a strong foundation in accounting principles, including the classification of accounts, the Double Entry System, the application of the Golden Rules of Debit and Credit, record financial transactions in journals, post them into ledgers, and prepare a Trial Balance.
- **CO2:** Understand the role of subsidiary books in accounting, including different types of cash books and their preparation; learn to reconcile differences between the Cash Book and Pass Book balances and prepare a Bank Reconciliation Statement
- **CO3:** Differentiate between capital and revenue expenditure, understand the concepts of bad debts and provisions for doubtful debts and gain the skills to prepare final accounts by incorporating necessary adjustments.
- **CO4:** Explore the concepts of savings and investment, including their benefits and differences, identify various investment avenues in physical and financial assets and understand the distinction between trading and investment to make informed financial decisions.
- **CO5:** Have a comprehensive understanding of financial markets, covering money and capital markets, key financial instruments, IPOs, stock exchanges, and mutual funds, and analyze the structure and functions of financial markets and assess different financial instruments used for investment.
- **CO6:** Acquire knowledge and skills in stock market investment and analysis, applying fundamental and technical analysis to evaluate stocks, learn to interpret stock market charts and patterns, assess stock price movements, and utilize various analytical tools for informed investment decisions.

MODULE 1: Introduction to Accounting

Concept and classification of Accounts, Transaction, Double Entry System of Book Keeping, Golden rules of Debit and Credit, Journal- Definition, Advantages, Procedure of Journalising, Ledger, Advantages, Rules regarding Posting, Balancing of ledger accounts, Trial Balance- Definition, Objectives, Procedure of preparation.

MODULE 2: Subsidiary Books, Cash Book and Bank Reconciliation

Name of Subsidiary Books, Cash Book- Definition, Advantages, Objectives, Types of Cash Book, Preparation of different types of Cash Books, Bank Reconciliation Statement, Reasons of disagreement between Cash Book with Pass Book balance, Preparation of bank Reconciliation Statement.

MODULE 3: Expenditures, Bad Debts and Final Accounts

Concept of Capital Expenditure and Revenue Expenditure, Bad Debts, Provision for Bad and Doubtful debts, Final Accounts: Preparation of Trading Account, Profit and Loss account and Balance Sheet with adjustments.

MODULE 4: Introduction to Saving and Investment

Savings: Concept, Benefits and saving alternatives, Disadvantage of Saving – Time Value of Money. Investment: Meaning, Advantage, Investment Avenues – Investment in Physical and financial assets, Difference between Saving and Investment; Trading- Meaning, Difference between Trading and Investment.

MODULE 5: Financial Market and Instruments.

Financial Markets and Instruments: Money Market, Capital Market, Money Market Instruments and features. Capital Markets and Features, New Issue Market and Stock Market; New Issue market- Initial Public Offering , Market Players, Secondary Market :Equity and Debentures, BSE and NSE, Index and its uses; Mutual Funds: Meaning and Types.

MODULE 6: Stock Market Investment and Analysis

Stock Market Investment: Fundamental Analysis- Economic Analysis-Industry Analysis and Technical Analysis - Tools of technical analysis, Understanding various types of charts and patterns- (Line chart, Bar Chart, Candlestick Chart Point and Figure Chart)

Course Code	Course Title	Hours per week L-T-P	Credit
AU241407	Environmental Science	3-0-0	0

Course Outcome (CO): After completion of the course, the students will be able to

- **CO1:** Relate environment and its associated problems
- **CO2:** Explain basic ethics of living and protection of other organisms
- **CO3:** Applying sustainable development principles

MODULE 1: Introduction

Environment and Ecology, Objectives of ecological study, Aspects of Ecology, Autecology, Synecology; Ecosystem, Structural and functional attributes of an ecosystem, Food chain and foodweb, Energy flow, Bio geochemical cycles

MODULE 2: Land: Use and Abuse

Land use: Impact of land –use on environmental quality, Land degradation, Control of land degradation, Wasteland, Wet lands

MODULE 3: Water Pollution

Introduction: Water quality standards, Water pollution

MODULE 4: Air Pollution

Introduction, Air pollution system, Air pollutants, Air pollution laws

MODULE 5: Noise Pollution

Sources of noise pollution, Effects of noise, Physical effects, Physiological effects

MODULE 6: Control of Pollutions

Control of water pollution and management, Water pollution legislations, Water quality management in surface water; Control of air pollution, source correction method, Pollution control equipment; controls of Noise pollution

Course Code	Course Title	Hours per week L-T-P	Credit
EI241411	Control Systems Lab	0-0-2	1

Prerequisites: Linear Control Systems

Course Outcome (CO): After completion of the course, the students will be able to

- **CO1:** Solve control system problems using MATLAB software
- **CO2:** Analyze the response of control system by measuring relevant parameters
- **CO3:** Interpret the role of various components in control system
- **CO4:** Compare theoretical predictions with experimental results to resolve any apparent differences

Module No.	Description	Contact hours
PART I:	Use of MATLAB software for solving Control System Problems	10
PART II:	To perform experiments on control systems using experimental kits LIST OF EXPERIMENTS: 1. Light Intensity Control Systems 2. DC Position Control Systems 3. Potentiometer Error Detector 4. Speed-Torque Characteristics of AC Servomotor 5. Synchro-Transmitter Control Transformer pair as an Error Detector	10
	<u>Total Contact Hours</u>	<u>20</u>

Textbooks/Reference Books

1. Mastering MATLAB, Pearson Education
2. Rao V. Dukkupati, Analysis and Design of control systems using MATLAB, New Age International Publishers, 2nd Edition

Course Code	Course Title	Hours per week L-T-P	Credit
EE241412	Electrical Machines Lab-II	0-0-2	1

Prerequisites: Knowledge of electrical circuits, electromagnetic induction and magnetic circuits

Course Outcome (CO): After completion of the course, the students will be able to

- **CO1:** Explain the mode of starting and switching-off with precautionary measures while handling different types of electrical machines
- **CO2:** Apply the theoretical concepts for experimentation with different electrical machines
- **CO3:** Develop report writing skills

LIST OF EXPERIMENTS

ExperimentNo.	Description	Contact hours
1	Retardation test on a D.C. Machine	3
2	No-load test and blocked-rotor test on 3-phase induction motor	3
3	Working of Single phase and three-phase Induction Regulator	3
4	V-Curves of a synchronous motor	3
5	Transformer connections (Delta-delta, Delta-Wye, Wye -Delta, Wye - Wye, Open Delta, Scott-T, Zig-zag)	3
6	Synchronization of alternators	3
	<u>Total Contact Hours</u>	18

Course Code	Course Title	Hours per week L-T-P	Credit
EI241413	Microprocessors and Microcontrollers Lab	0-0-2	1

Course Outcome (CO): After completion of the course, the students will be able to

- **CO1:** Understand the architecture and the instruction set of 8085 microprocessor
- **CO2:** Design and develop programs using 8085 microprocessor kit and 8051 microcontrollers
- **CO3:** Write an engineering report in an organized way

Experiment No.	Description	Contact hours
1	Familiarization of the Microprocessor Kit: a) editing a program (b) Verifying the program (c) Executing the program and verifying the outcome of the program.	2
2	Programming of 8085: Developing and testing simple program for data transfer, block transfer, sorting of data, arithmetic operations, interrupt,	6
3	Interfacing 8255, traffic light control system	4
4	Programming of 8051 using embedded C: Develop simple programs for implementation in 8051 systems	8
	Total Contact Hours	20

Textbooks/Reference Books

1. Ramesh Gaonkar, Microprocessor Architecture, Programming and Applications with the 8085, Penram International Publishing Pvt. Ltd, 2013

Course Code	Course Title	Hours per week L-T-P	Credit
PR241415	Micro Project (Skill Based)	0-0-4	2

Prerequisites: Knowledge of basic science

Objectives:

- To identify problems based on societal or research needs
- To acquaint with the process of solving the problem in a group
- To apply engineering knowledge to attempt solutions to the problems

Course Outcome (CO): After completion of the course, the students will be able to

- CO1: Analyze engineering problems and their solutions
- CO2: Apply modern engineering tools to attempt solutions to the problems
- CO3: Adapt with computational thinking and automation skills
- CO4: Realize the need of professional communications, team work and self-learning

General Guidelines:

1. Students shall form a group of 3 to 4 students.
2. Each group shall conduct field survey or literature survey in consultation with faculty supervisor/mentor or internal project committee of faculty members to identify the needs of the society.
3. Each group shall formulate the problems on the basis of their survey and submit the implementation plan to the concerned faculty supervisor/mentor or the committee.
4. A log book is to be maintained by each group, wherein the group can record the work progress. The supervisor shall monitor the progress.
5. The faculty supervisor/mentor or the committee may give inputs to the students during the project activities, however, focus shall be on self-learning.
6. Students in a group shall understand problem effectively, propose multiple solutions and select the best solution in consultation with faculty supervisor/mentor or the committee.
7. Students shall convert the best solution into a working model/prototype using various components of their domain areas.
8. Students shall demonstrate and validate the model with proper justification and a report is to be compiled in a standard format/template

Assessment Criteria:

The Micro Project shall be assessed based on the following criteria:

Sl No.	Component	Weightage
1	Proper identification of the problem	20
2	Quality of survey	15
3	Clarity of problem definition	10
4	Presence of innovation	5
5	Effective use of modern engineering tools	10
6	Cost effectiveness	5
7	Societal impact	10
8	Functioning of the working model	15
9	Fulfilment of standard engineering norms	5
10	Clarity in written and oral communication	5
		100

Examinations:

Sl No.	Type of examination/evaluation	Marks (50)
1	Mid-term presentation on Progress	10
2	Demonstration of the project	10
3	End-term presentation	25
4	Viva-voce examination	5
